

> Client Brief

Personal Date Night

Project description:

Sometimes you just need a break from your partner but you already got a babysitter. Now couples can go to different events in similar locations and at the same time.

Requirements:

- [Ticketmaster](#) API
- Users input a time range and get results that start and end in that block of time
- Users can filter those results by keyword, type of event, or venue
- One person can lock in their choice while the other is still searching for something to do
- Once both users choose their activities and are emailed separate links to purchase tickets to those events
- Comprehensive error handling

Stretch goals:

- Make a downloadable calendar event
- Users can “favorite” certain events to pick from later
- Users can filter results by ticket price, how rare the event is in this location
- Couples can save their chosen dates, event details, and ticket purchase links privately in Firebase (i.e. two authenticated users for one account)
- Order events by distance from a specified address (MapQuest API, probably)

Deliverables:

- Project files up on GitHub
- Project up on GitHub pages or your own URL
- All requirements completed BEFORE any stretch goals have been attempted
