

# Client Brief

## Dinner after show

---

### Project description:

**This client loves dinner and a show. Build an app that provides a list of walkable restaurants based on an inputted show/event. Help them plan out their night!**

### Requirements:

- Firebase, Ticketmaster and Zomato API
- Users should be able to find events based on city
- From events results - thumbnails should ideally show a short snippet of information (name, what time, venue information, date, image)
- Based on the show/event they choose, generate a list of restaurants that are within a 1000 meter radius
- From restaurant results - thumbnails should ideally show a short snippet of information (name, address, cuisine, rating)
- Users can click on any results for restaurants/show and get additional relevant information
- Allow users to save/unsave chosen show and chosen restaurant combo for later
- Proper error handling. For example:
  - If a user types in a query that yields no result - they should be provided feedback (e.g. there were no restaurants/show found)
  - Common error responses should be handled

### Stretch goals:

- **Sorting and filtering for search results and/or saved items**
- **Pagination for search results and/or saved items**
- **Fun loading animation**
- **Authorization and Guest login.** Guest login should have the same functionality as authorized users, except authorized users' saved combos will be private. Guests can see other guests' combos. (Guest account means the app should have a flow where there is no authorization required)

### Deliverables:

- Project files up on GitHub
- Project up on GitHub pages or your own URL
- All requirements completed BEFORE any stretch goals have been attempted
