

Project description:

Create an app that allows people to take a quick anonymous poll. Users should be able to create a polling room that can be shared with anyone who should take part in the poll. The poll creator should be able to keep track of how many people have voted and then get or display the secret results.

Requirements:

- Use Firebase to store voting booth information and user's votes
- There should be multiple (unlimited) voting booths that can be created and shared
- There should be feedback on how many people have completed the poll
- Proper error handling. For example:
 - Voters should only be able to vote once per device (look into local/session storage)
 - Users must choose an option to submit their vote

Stretch goals:

- Add a time limit option to the poll
- Add different answer options other than yes or no
- Allow the user to change the look and feel of the polling booth
- Show a preview of the poll as you are creating it
- Add a user account to keep track of former polls you have created
- Create conditions to alert the creator and email the results to all the poll users based on the amount of users taking the poll.

Deliverables:

- Project files up on GitHub
- Project up on GitHub pages or your own URL
- All requirements completed BEFORE any stretch goals have been attempted
