

## Project description:

Love having friends over that have dietary restrictions, but hate it when you accidentally send them to the hospital out of negligence?

We want you to create an app that lets users add any guests or family members with dietary restrictions, and uses the Yummly API to find recipes that can be eaten by everyone at your dinner party. Bone apple tea!

## Requirements:

- Use Firebase to store user data
- User should be able to create guests and add allergies to their profile
- User should be able to create a new dinner party and add guests to it
- Users can then search for recipes using the Yummly api to get recipes based on dietary restrictions
- Proper error handling. For example:
  - If a user types in a query that yields no result - they should be provided feedback (e.g. there were no items found)
  - Common error responses should be handled
  - API loading states

## Stretch goals:

- A gallery page that shows all the parties created and their guests
- Users can opt in to create a profile to save their most used recipes

## Deliverables:

- Project files up on GitHub
- Project up on GitHub pages or your own URL
- All requirements completed BEFORE any stretch goals have been attempted

## Brand Colours:

#4F6A35

#E6AC5C

#A4CA50

Heading Font: Playfair Display (Black 900)

# HEADING FONT

Body Font: Montserrat (Regular 400)
