

Client Brief

Budget App

Project description:

You're living that sweet dev salary life now and want to find a way to best manage those buckets of money. The user should be able to input their upcoming pay date(s) and amount(s) and then the app will calculate and display a daily budget (eg. I get paid \$2000 in 10 days so I have \$200/day). Users will input their expense items for the day and the app will track if they are under/over their daily spending limit and change the average daily budget accordingly (i.e. user spends \$300 instead of \$200 and their average for the next 9 days goes down to \$188.88/day).

Requirements:

- Uses firebase
- Users can input paydays and pay amounts
- Users can input a list of expense items
- Daily budget will fluctuate based on over and under spending

Stretch goals:

- Users can group spending items with a category/tag and then there will be visual feedback indicating which categories they have spent the most money on
- Using the giphy API display a good times (your choice what to query) gif for users who submit expenses under their daily limit and a bad times gif for users who exceed their daily limit
- Authorization and Guest login. Guest login should have the same functionality as authorized users, except authorized users' saved lists will be private. Guests can see other guests' lists (Guest account means the app should have a flow where there is no authorization required)

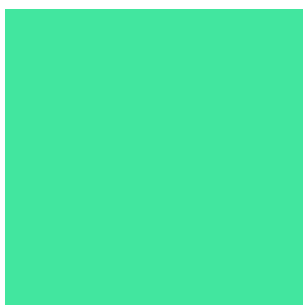

Deliverables:

- Project files up on GitHub
- Project up on GitHub pages or your own URL
- All requirements completed BEFORE any stretch goals have been attempted
