

# How to use Photopea

For Photoshop files

Go to <https://www.photopea.com/>

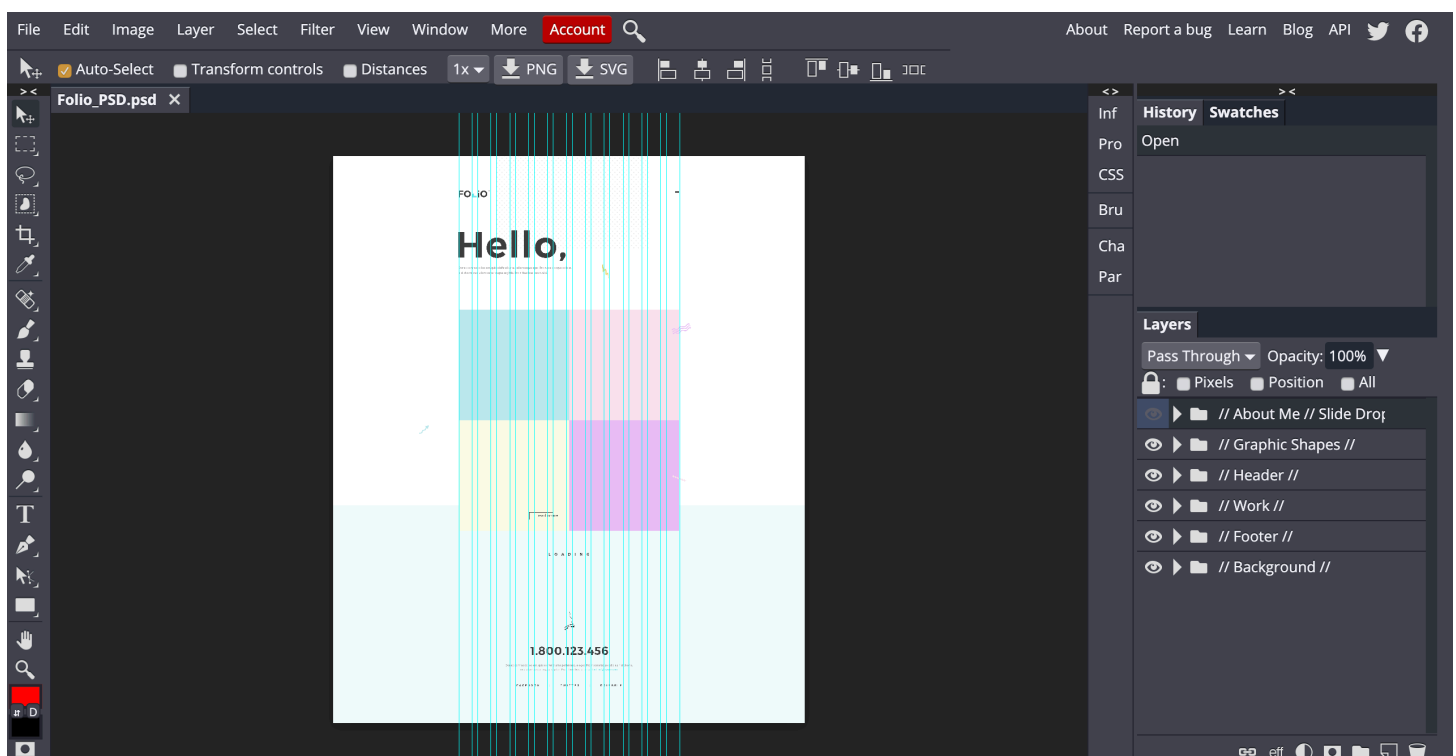

## Open PSD file

- Go to **File > Open** or **Ctrl+O**
- Select file then **Open** button

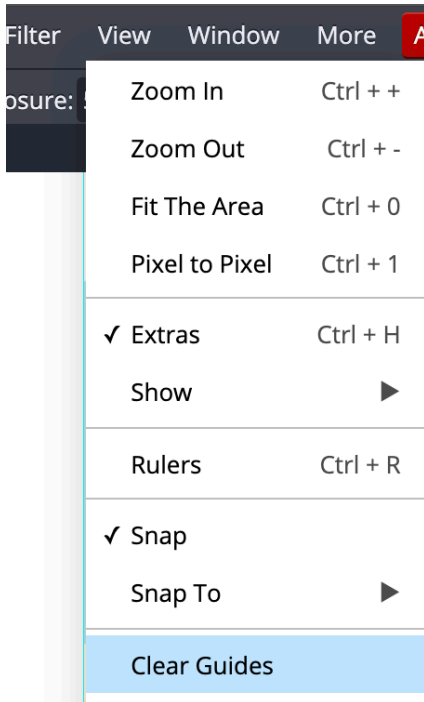

## Understanding what we see

In the center we see our file, with guides. Left panel are our tools and right panel are Layers (meaning where assets are)

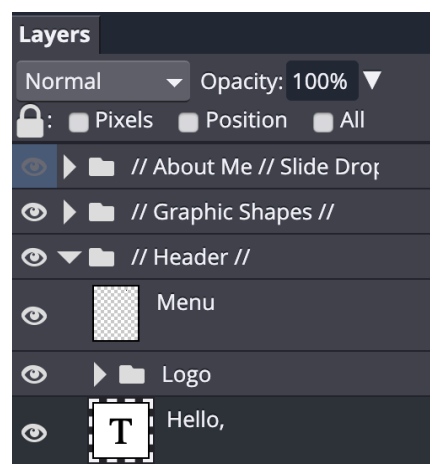

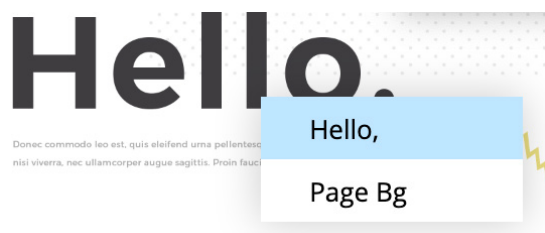

## Removing Guides

- Go to **View > Clear Guides**

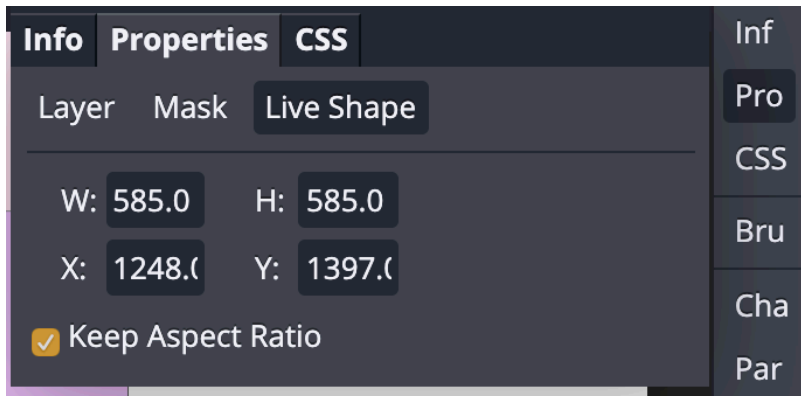

## Selecting and finding elements in Layers panel

- Use select tool 
- Right-click on element on page, then click on name
- If you then look over at your layers you see the elements selected

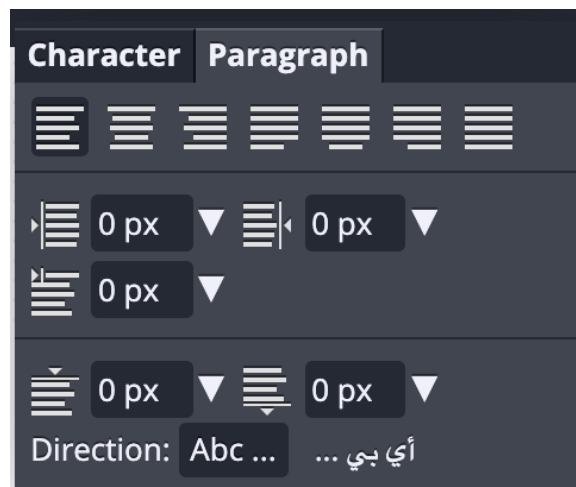

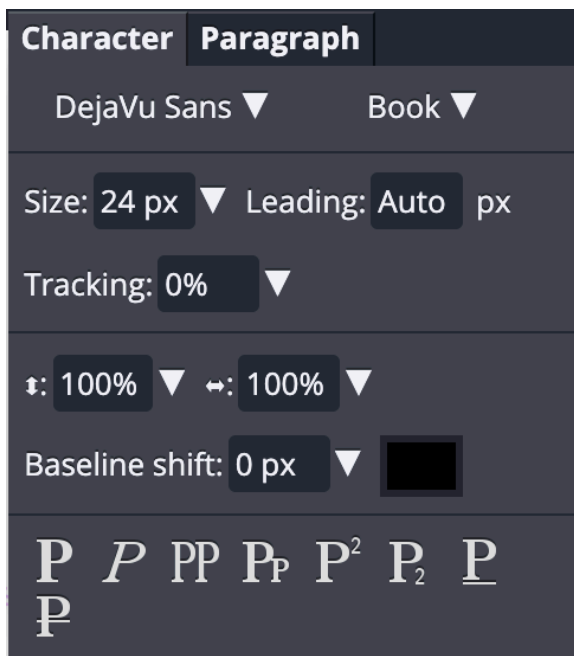

## Getting details about elements

- Once element is selected, you will have access to some additional information.
- In *Pro* you will have dimensions and positioning base on file viewport

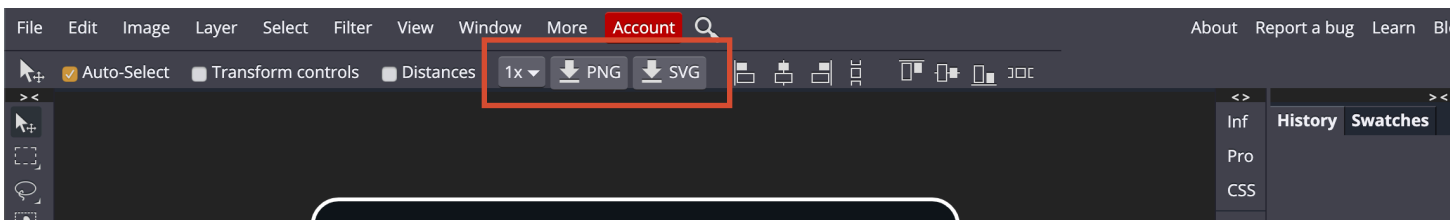

- For text, you can look at *Cha* and *Par* for font info
- If you then look over at your layers you see the elements selected

## How to export elements

- Your file might have some elements you want to export, like shapes or images.
- There are two ways to do this. First way is, once element is selected, there are two buttons at the top tool bar (in orange rectangle)
- You have the option of exporting element as PNG or SVG.

- The second way is to navigate to **File > Export as >** and you will have more option (PNG, JPG, SVG, GIF...)
