Quick Flick Picker
Client Brief

Project description:

Create an app that helps the indecisive finally pick a movie to watch. Users can create and name lists of movies they want to watch (e.g. Oscar Winners, Movies to make me seem cultured, Movies to put on while I'm cleaning, Thrillers, etc). Users can search for a movie to add to their lists based on a query search. With each list, users can fill out a natural language form, based on two criteria "I feel like watching a {genre} movie, and I have {less than 1.5 hrs/ less than 2 hours/all the time in the world}". The app will then pick a random movie from the form inputs.

Requirements:

- Uses MovieDB API and Firebase
- Users can create lists
- Users can search for a movie based on a query, results should include relevant movie details (title, description, director, cast, genre, trailer (API returns youtube key to embed))
- Users can add/remove movies from their lists
- When users view a list, it should show the list of movies on that list, along with the natural language form. Upon submitting the form, it spits out one movie from that list. Natural form genre options should be generated from the movies on that list.
- Proper error handling. For example:
  - If a user types in a query that yields no result - they should be provided feedback (e.g. there were no movies found)
  - Common error responses should be handled
  - API loading states

Stretch goals:

- Filter search results based on various criteria (eg. genre, MPAA rating, etc)
- Sorting (e.g. alphabetical, user rating, etc)
- Authorization and Guest login. Guest login should have the same functionality as authorized users, except authorized users' movie lists will be private. Guests can see other guests' lists.

Deliverables:

- Project files up on GitHub
- Project up on GitHub pages or your own URL
- All requirements completed BEFORE any stretch goals have been attempted
